

Every AI you use forgets you the moment you close the tab.

Tell ChatGPT something important, and Claude never knows it happened. Explain your project to Gemini, and you start from zero again — copy-pasting, re-coaching, re-explaining. Do that across every tool you use and you are not saving time with AI — you are spending it re-explaining yourself, and paying twice for context you already had.

Kemory is one memory layer that sits across every AI you use. Tell it once, and it is there for whichever tool you open next.

● WHAT YOU GET

- 01 **Kora for Chrome.** Gathers your conversations from every AI you use, as you work, into one memory you own.
- 02 **Ask Kora.** Our AI chief of staff. Answers come back already knowing what you told the other AIs, so you spend fewer tokens catching each one up.
- 03 **Carry a thread across.** Bring any chat into Kora and pick it up in another AI, without copy-pasting or teaching it again.
- 04 **Convene your own AI council.** Ask several models the same question, see where they disagree, and get one synthesised answer. Or hand a piece of work to whichever model suits it — your knowledge stays in one place either way.
- 05 **They are your chats and your memory. Not ours.** Export the lot whenever you like, or self-host — Kora and the memory layer are open source.

FREE, AND IT STAYS FREE

Kora for Chrome
2,000 memories and chats

Two connected AIs
Credits under fair use

Plus 1,000 more memories and chats, permanently, for every person who joins on your link — for them too.
